Oyster TeePee™ Kits

Growing Oysters on Toilet Paper

The Basics

The ultimate recycling plan! Convert rolls of toilet paper into edible mushroom bouquets. Toilet paper rolls are submerged in boiling water until they are completely saturated. Once cooled the centers of each roll are stuffed with grain spawn. One 2 lb. bag of grain spawn will inoculate 7 rolls of toilet paper and one 4 lb. bag of grain spawn should inoculate 15 rolls. Rolls are then placed in the provided bags, rubber banded closed and stored in a darkened area for a few weeks to incubate. When proper growth has been achieved the rolls are cooled for a short period of time and then placed in an area that receives ample light and humidity. Rolls will need to be misted occasionally to prevent them from drying out. The entire process takes between 4-6 weeks. These kits are great for classrooms and science fair projects!

Mushrooms of Many Colors

The Ultimate in Color Range

Watch a full palette of Oyster mushrooms emerge before your eyes in this colorful TeePee™ Kit! The kit is similar to the TeePee™ Kit above, but includes enough grain spawn to make 21 toilet paper rolls, 7 each of 3 of the following 4 strains (based on availability and shipping temperature constraints): Golden, Italian, PoHu™ and Grey Dove™.

Note:

Growing on toilet paper is not a method recommended for growing commercially.

*More detailed instructions are included with every spawn or kit purchase!
